

PRODUCT CARBON FOOTPRINT

CARBON FOOTPRINT OF A PRODUCT (CPF) IS A SUM OF GREENHOUSE GAS EMISSIONS AND REMOVALS IN A PRODUCT SYSTEM EXPRESSED AS CO₂e EQUIVALENTS (CO₂e) AND BASED ON A LIFE CYCLE ASSESSMENT USING THE SINGLE IMPACT CATEGORY OF CLIMATE CHANGE. GREEN HOUSE GASES GHGS ARE EMITTED AND REMOVED THROUGHOUT THE LIFE CYCLE OF A PRODUCT (I.E. CRADLE-TO-GRAVE) FROM RAW MATERIAL ACQUISITION THROUGH PRODUCTION, USE AND END-OF-LIFE TREATMENT. CARBON FOOTPRINT CALCULATION IS IN ACCORDANCE WITH TECHNICAL SPECIFICATION OF CPF GIVEN BY ISO NORM 14067:2013.

DETERMINATION OF TREND

The biggest part (77,5%) of product carbon footprint are raw materials, especially aluminium and paints. Transporting raw materials to the plant in Bojkovice and transporting products to customers together make up 0.65% of the carbon footprint of the product. The processing of the product is 21% of total emissions related to the product lifecycle - aluminium monoblock aerosol containers. Production-related wastes and packaging do not represent a significant burden on the environment in terms of carbon footprint.
